

# Data Extraction

Once you have [configured](#) your Interventions and Data Elements, you are ready to extract data from all included studies in the nest.

## Steps for Data Extraction:

### 1. Navigate to Extraction

Select “Extraction” from the menu:

Nest Home

Dashboard

Settings

Literature Search

3 / 3

Other Sources

Duplicate Review

Search Exploration

Query Builder

Screening

277 / 279

Configure Screening

Tagging

4 / 4

Configure Tagging

Extraction

4 / 4

Configure Extraction

Risk of Bias

4 / 4

Study Inspector

Synthesis

Manuscript Editor

Abstract Editor

Export

Alternatively, you can Extract data from the “Extract” tab in Inspector. See [here](#) for details on how to get to the Study Modal.

## 2. Add Study Arms

Study Arms represent the patient groups you plan to extract.

## 2a. Add Rows

To add study arms and identify the Intervention used for each arm, click the “+” button (red circle) in the Study Arms section of the Study Design panel (upper right). Add one Arm for every patient group from the study you plan to extract.

The screenshot shows the Yonsei Medical Journal (YMJ) article page. The article title is "A Single Flow Re-direction Endoluminal Device for the Treatment of Large and Giant Anterior Circulation Intracranial Aneurysms". The Study Design panel on the right shows the "Arms" section with a dropdown menu for "Intervention" and a red arrow pointing to the "+" button to add a new arm.

## 2b. Identify Interventions

Then, determine what Intervention the study investigated and then find that Intervention using the Intervention drop down menu (see above, red arrow).

## 2c. Identify Arm Sizes

Next, determine how many participants were included in the study and put that number in the “Arm Size” box.

**Add a new Study Arm for every patient group you want to extract separately.**

## 3. Extract the Data:

Once you have finished establishing the Study Arms, you are ready to extract the data from the underlying study. The first step in doing so, for each Data Element, is establishing the Measurement Timepoint for each Data Element.

### 3a. Select Measurement Timepoints

Each Data Element has one Timepoint presented by default; select whether this timepoint will be:

- **Baseline:** Usually reported at the start of a study. One Baseline timepoint per Data Element will be displayed on Synthesis.
- **Outcome:** Reported at a designated follow-up period. One Outcome timepoint per Data

Element will be displayed on Synthesis.

- **Other:** Any additional timepoint reported that is of interest. Any number of Other timepoints may be created and saved in AutoLit, but **“Other” timepoints will not be presented on Synthesis.**

↶

Filter Data Elements

↷

Age (Mean)

	Timepoint	Time	Units				
✓	Baseline	0	Days				
	Baseline	Mean (years)	SD	N			
✓	Outcome				66.8	13.1	154
✓	Other				67.2	11.9	146

Male Sex

	Timepoint	Time	Units	
✓	Baseline	0	Days	
	Arm	Events	Total	
✓	Endovascular therapy plus/minus medical therapy	100		154
✓	Standard medical therapy only	96		146

Mortality

	Timepoint	Time	Units	
✓	Outcome	90	Days	
	Arm	Events	Total	
✓	Endovascular therapy plus/minus medical therapy	59		154
✓	Standard medical therapy only	63		146

mRS 0-2

	Timepoint	Time	Units	
✓	Outcome	90	Days	
	Arm	Events	Total	
✓	Endovascular therapy plus/minus medical therapy	54		154
✓	Standard medical therapy only	44		146

When you designate a timepoint as “Baseline” or “Outcome”, you are designating that its data should be pooled with other studies' data. This means that the Measurement Timepoint you designate as “Outcome”, for instance, in each study, must be similar to the “Outcome” timepoint designated in all other studies in that nest.

3b. Enter Time and Units for each Measurement Timepoint

For each Timepoint, enter the follow-up period with the appropriate unit of time (Days, Weeks, etc.). For Baseline Timepoints, this will typically be 0 days.

3d. Changes to Total Population / Loss to Follow-up

*If the total population for any Data Element differs from the total population you reported for the Study Arm as a whole, ensure that you edit this information in the “Total” column for that individual Data Element.*

3e. How to use Tags to inform Extraction

If you hover over the tag symbol on each data point (see Figure above, red circles), you will notice that the tags applied will appear. This allows for a quick and efficient way to confirm the work of the taggers, as well as the tags giving information to you as the extractor.

3f. How to use the "Status" symbols

**CAUTION:** Watch for the red Xs that appear under “Status”. This means something is wrong with the data (missing information, non-numerical information, or other error).

Comments (2)

⤵

*If any of your data elements have a red X, DO NOT hit “Complete”. You will need to figure out the problem and fix it before hitting “Complete” or risk losing the data from that row.*

#### 4. Complete Data Extraction

Once you have input all of the relevant and correct data AND all of the timepoints for each Data Element you extracted have a green check mark, you can hit complete and move onto the next study!
