

# Data Extraction

Once you have [configured](#) your Interventions and Data Elements, you are ready to extract data from all included studies in the nest.

## Steps for Data Extraction:

### 1. Navigate to Extraction

Select “Extraction” from the menu:

Alternatively, you can Extract data from the “Extract” tab in Inspector. See [here](#) for details on how to get to the Study Modal.

### 2. Add Study Arms

To add study arms and identify the Intervention used for each arm, click the “+” button (red circle) in the Study Arms section of the Study Design panel (upper right). Add one Arm for every patient group from the study you plan to extract.

The screenshot displays the Autolit interface. On the left, a PubMed article titled "A Single Flow Re-direction Endoluminal Device for the Treatment of Large and Giant Anterior Circulation Intracranial Aneurysms" is shown. The article is from the Yonsei Medical Journal (YMJ), published in 2022. On the right, the "Study Design" sidebar is open, showing a table with columns for "Intervention" and "Arm Size". The "Intervention" dropdown menu is open, showing options like "FRED", "No Selection", "Balt", "Bioinert surface...", "Carotid vessel de...", "Coiling", "Coils + subseque...", "Combination ste...", "Comparator Ther...", "Conservative Ma...", "Derivo/blue oxid...", "eCLIPS", "Flow Diverter", "FRED + coils", and "eCLIPS". A red arrow points to the "No Selection" option. The "Arm Size" column shows a value of 55. A red circle with a plus sign is next to the "Arm Size" column header.

Then, determine what Intervention the study investigated and then find that Intervention using the Intervention drop down menu:

FIGURE

Next, determine how many participants were included in the study and put that number in the "Arm Size" box.

FIGURE

**Add a new Study Arm for every patient group you want to extract separately.**

### 3. Extract the Data:

Once you have finished establishing the Study Arms, you are ready to extract the data from the underlying study. The first step in doing so, for each Data Element, is establishing the Measurement Timepoint for each Data Element.

#### 3a. Select Measurement Timepoints

Each Data Element has one Timepoint presented by default; select whether this timepoint will be:

- **Baseline:** Usually reported at the start of a study. One Baseline timepoint per Data Element will be displayed on Synthesis.
- **Outcome:** Reported at a designated follow-up period. One Outcome timepoint per Data Element will be displayed on Synthesis.
- **Other:** Any additional timepoint reported that is of interest. Any number of Other timepoints may be created and saved in AutoLit, but **"Other" timepoints will not be presented on Synthesis.**

FIGURE

When you designate a timepoint as “Baseline” or “Outcome”, you are designating that its data should be pooled with other studies' data. This means that the Measurement Timepoint you designate as “Outcome”, for instance, in each study, must be similar to the “Outcome” timepoint designated in all other studies in that nest.

### 3b. Enter Time and Units for each Measurement Timepoint

For each Timepoint, enter the follow-up period with the appropriate unit of time (Days, Weeks, etc.). For Baseline Timepoints, this will typically be 0 days.

FIGURE

### 3c. Extract the Data for each Measurement Timepoint

Read through the study and extract the relevant data scoped to each specific Timepoint. ***If the total population for that Data Element differs from the total population you reported for the Study Arm as a whole, ensure that you edit this information in the “N” column.***

FIGURE

### 3d. How to use Tags to inform Extraction

If you hover over the tag symbol on each data point, you will notice that the tags applied will appear. This allows for a quick and efficient way to confirm the work of the taggers, as well as the tags giving information to you as the extractor.

FIGURE

### 3e. How to use the "Status" symbols

**CAUTION:** Watch for the red Xs that appear under “Status”. This means something is wrong with the data.

FIGURE

***If any of your data elements have a red X, DO NOT hit “Complete”. You will need to figure out the problem and fix it before hitting “Complete” or risk losing the data from that row.***

---

## 4. Complete Data Extraction

Once you have input all of the relevant and correct data AND all of the timepoints for each Data Element you extracted have a green check mark, you can hit complete and move onto the next study!
