

# Manuscript Editor

This page describes how to draft and edit Manuscripts in AutoLit. To learn how to view and interpret the Manuscript output in Synthesis, click [here](#).

## 1. Navigate to "Manuscript Editor"

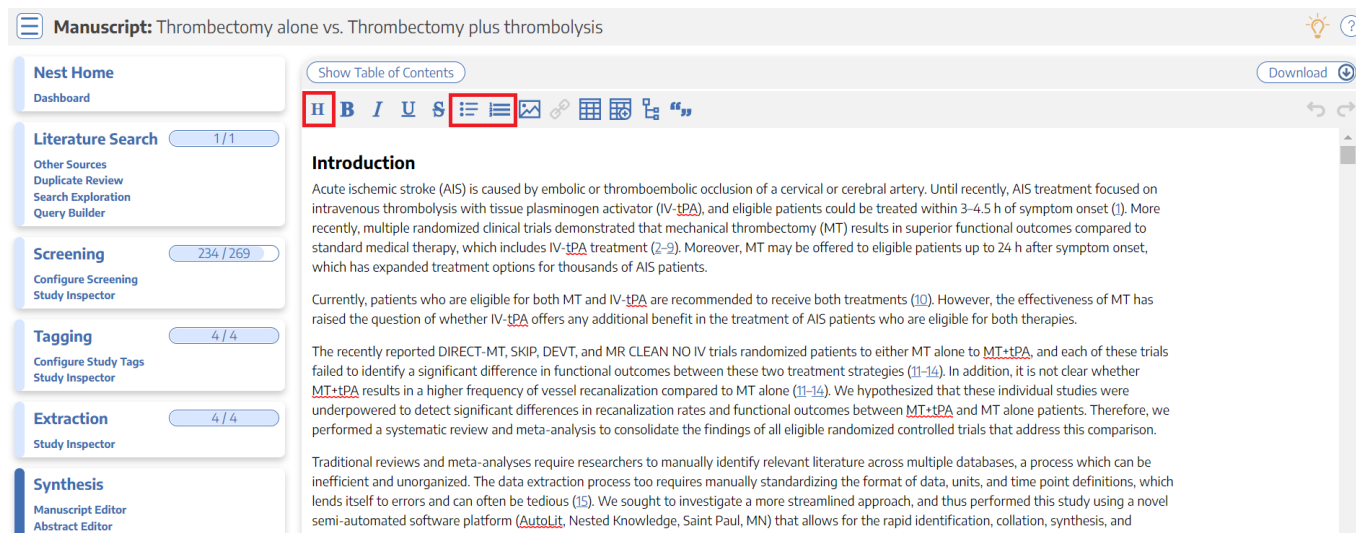

Below the “Synthesis” link, find the “Manuscript Editor.”

## 2. Drafting Tools

In the Manuscript Editor, you can type up any free-text findings; you can also insert:

- **Headings:** Click the “H” in the top menu (red arrow below)
- **Bullet points or enumerated lists:** To the left and right, respectively, of the red box below
- **Images:** Click the mountain-image icon next to the red box.

The screenshot shows the Manuscript editor interface. The title bar reads "Manuscript: Thrombectomy alone vs. Thrombectomy plus thrombolysis". On the left is a sidebar with navigation options: Nest Home (Dashboard), Literature Search (1/1), Screening (234 / 269), Tagging (4 / 4), Extraction (4 / 4), and Synthesis (Manuscript Editor, Abstract Editor). The top toolbar contains various editing tools, with the "Show Table of Contents" button (represented by a list icon) highlighted with a red box. The main text area shows the "Introduction" section of a manuscript, discussing acute ischemic stroke (AIS) and treatment options like intravenous thrombolysis and mechanical thrombectomy (MT).

## Generate a Table of Contents

Select "Show Table of Contents" to add a table of contents, which will be automatically generated from the Headers you have created.

## Can multiple people edit the Manuscript at once?

At this time, only one person can edit the manuscript at a time. If multiple users make edits, their changes may be overwritten. ...Don't worry, we plan to support collaborative editing in the future and you can track. [our progress](#)

## How are edits saved?

Manuscript editor saves your work automatically. You can see the last time the Manuscript was saved in the upper right of the page, right next to the "undo" and "redo" buttons:

This screenshot shows the top right corner of the Manuscript editor. It includes a "Download" button and a status indicator that says "Autosaved 3:52 PM", which is highlighted with a red box. Next to the status are "undo" and "redo" buttons.

## 3. Insert Updatable Tables

To insert an updatable table, select the table icon with the plus sign. When the included studies and collected data change, the tables will update accordingly.

Introduction

Acute ischemic stroke (AIS) is caused by embolic or thromboembolic occlusion of a cervical or cerebral artery. Until recently, AIS treatment focused on intravenous thrombolysis with tissue plasminogen activator (IV-tPA), and eligible patients could be treated within 3–4.5 h of symptom onset (1). More recently, multiple randomized clinical trials demonstrated that mechanical thrombectomy (MT) results in superior functional outcomes compared to standard medical therapy, which includes IV-tPA treatment (2–9). Moreover, MT may be offered to eligible patients up to 24 h after symptom onset, which has expanded treatment options for thousands of AIS patients.

Currently, patients who are eligible for both MT and IV-tPA are recommended to receive both treatments (10). However, the effectiveness of MT has raised the question of whether IV-tPA offers any additional benefit in the treatment of AIS patients who are eligible for both therapies.

The recently reported DIRECT-MT, SKIP, DEVT, and MR CLEAN NO IV trials randomized patients to either MT alone to MT+tPA, and each of these trials failed to identify a significant difference in functional outcomes between these two treatment strategies (11–14). In addition, it is not clear whether MT+tPA results in a higher frequency of vessel recanalization compared to MT alone (11–14). We hypothesized that these individual studies were underpowered to detect significant differences in recanalization rates and functional outcomes between MT+tPA and MT alone patients. Therefore, we performed a systematic review and meta-analysis to consolidate the findings of all eligible randomized controlled trials that address this comparison.

Traditional reviews and meta-analyses require researchers to manually identify relevant literature across multiple databases, a process which can be inefficient and unorganized. The data extraction process too requires manually standardizing the format of data, units, and time point definitions, which

This will open a modal where you customize and build your Updatable Table:

## Insert Updatable Table

Updatable tables allow you to define tables populated with living data from this Nest, meaning the table will update when records are updated, added, or deleted. Specify the type of data, columns, and filters for your table:

Table of:

Title	First Author	Year	Intervention	Arm Size
Effect of Endovascul...	Zi, Wenjie	2021	Unknown MT	116
Effect of Endovascul...	Zi, Wenjie	2021	Unknown MT + IVT	118
Effect of Mechanical...	Suzuki, Kentaro	2021	Unknown MT	101
Effect of Mechanical...	Suzuki, Kentaro	2021	Unknown MT + IVT	103
Endovascular Throm...	Yang, Pengfei	2020	Unknown MT	327

To build an Updatable Table, select the Table of, Filters, and Columns you desire. This builder functions in the same way that the Custom Table Export does, so for a full review of how each table type works, see instructions [here](#).

## Add Citation information to Updatable Tables

The Updatable Table allows bibliographic fields to be added one-by-one; however, if you want to insert all citation data in one click, select “Bibliographic Data” → “Citation” in the modal:
