

# Search

Literature Search is the starting point for adding studies to your nest. In order to proceed to Screening records, you will need to add studies by Executing Searches, Importing RIS Files, or adding Other Sources.

## Literature Search

Literature Search contains the final records of your searches and imports. Also, from this module, you can:

- [Execute Searches](#) of the PubMed database directly via [API](#).
- [Import RIS Files](#) containing study metadata from searches on other databases (e.g. Embase).
- Set an Update Schedule for API-based searches.

To support your Search creation, we also offer the following search building features:

- [Search Exploration](#), where you can add terms of interest and expand on your initial ideas based on AI recommendations of additional terms and review of candidate studies.
- [Query Builder](#), where you can turn your Search Exploration outputs into a Boolean query and review the automatically generated code.

## Adding Other Sources

In addition to API-based searches and RIS Import, we offer two methods for adding studies directly to a nest:

- [Adding Studies Individually](#) based on DOI, PMID, or manual entry of metadata, and
- [Bibliomining](#) the references from the PDFs of existing reviews or studies.

## Editing and Reviewing References

We automatically import metadata and run a de-duplication algorithm to ensure we save only one version of each study. In order to check both the metadata and deduplication, you can use:

- [Duplicate Review](#): Examine and edit the outputs of our de-duplication algorithm.
- [Edit References](#): Edit the metadata of studies.
