

Query Builder

The purpose of the Query Builder is to provide an environment to:

1. Review the automatically-built structure of the query code from [Search Exploration](#)
2. Test the query on PubMed to see all records returned (as well as the total number of records).
3. Append any further strings to your query (such as standard negations regarding study type or date).

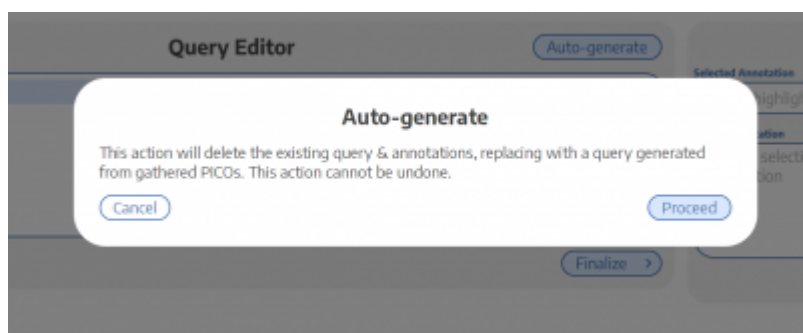

How to use Query Builder

Navigate to the Query Builder

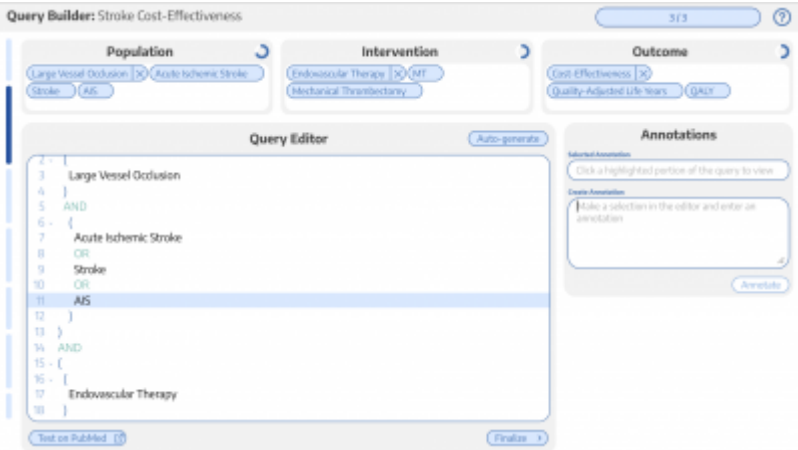

You can also go straight to Query Builder from Search Exploration.

Auto-Generate based on PICO elements

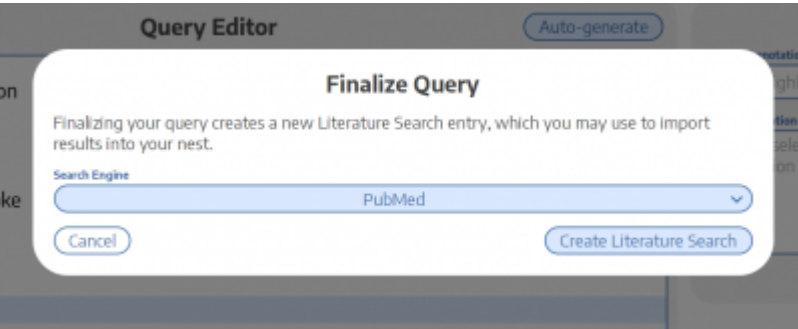

Note: After the first time you proceed from Search Exploration to Query Builder, changes to Search Exploration will **ONLY be populated to the Query Builder** if you select “Auto-generate”. This is to prevent accidental overwriting of your Query Builder content.

View and Modify your Query

Finalize Query and Add Terms to Search
