

Query Builder

The purpose of the Query Builder is to provide an environment to:

- 1. Review the automatically-built structure of the query code from [Search Exploration](#)
- 2. Test the query on PubMed to see all records returned (as well as the total number of records).
- 3. Append any further strings to your query (such as standard negations regarding study type or date).

How to use Query Builder

Navigate to the Query Builder

You can get to Query Builder from the AutoLit Menu or directly from Search Exploration.

Auto-Generate based on PICO elements

Auto-Generating will pull the full, updated query from Search Exploration.

Query Builder: Atypical Antipsychotics for Schizophrenia

Population: Schizophrenia

Intervention: Atypical Antipsychotics, Risperidone, Aripiprazole, Clozapine

Outcome: Quality of Life, Disability, PANSS

Query Editor

Auto-generate

Annotations

Selected Annotation: Click a highlighted portion of the query to view

Create Annotation: Make a selection in the editor and enter an annotation

Test on PubMed Finalize

Note: After the first time you proceed from Search Exploration to Query Builder, changes to Search Exploration will **ONLY be populated to the Query Builder** if you select “Auto-generate”. This is to prevent accidental overwriting of your Query Builder content.

View and Modify your Query

In the Query Editor, you can add, edit, or delete rows of content. The Parentheses and Boolean operators (AND/OR/NOT) are provided in their own rows, and any edits you make will be saved toward your final search. You can also attach Annotations to any row, which will be saved in Query Builder to provide context and history of the rationale for your search construction.

Test on PubMed

If you select Test on PubMed, it will open a new tab running your query directly on PubMed. Use this feature to ensure that the structure of your query functions (e.g. parenthesis matching) and view the number and content of your search results.

Finalize Query and Send to Literature Search

When finished reviewing your query, select Finalize to send your query forward to your final [Literature Search](#)!

The screenshot shows the 'Nested Knowledge' Query Builder interface. The main query is 'Atypical Antipsychotics for Schizophrenia'. The interface is divided into sections: Population (Schizophrenia), Intervention (Atypical Antipsychotics, Risperidone, Aripiprazole, Clozapine), and Outcome (Quality of Life, Disability, Positive and Negative Syndrome Scale, PANSS). A 'Finalize Query' dialog box is open, asking the user to confirm creating a new Literature Search entry. The dialog includes a 'Search Engine' dropdown set to 'PubMed' and a 'Create Literature Search' button. The background query editor shows a complex query structure with numbered lines and parentheses.
