

Planning a Review or Meta-Analysis

- [Is Your Systematic Review Feasible](#)
- [Protocol Writing and Registration](#)

Define a strong research question and hypothesis include:

- Identifying the “primary and secondary aims of the study” through creating a [great literature search](#).
- Scan the current literature to identify gaps in the field. This can be done on PubMed.
- Using the **PICO** acronym **P**opulation, **I**ntervention, **C**ontrol, and **O**utcome when formulating the research question.

Establishing a Study Team

- Identify a team lead or project manager to organize project tasks, and ensure that the study protocol is followed.
- Identify “independent reviewers” or [team members](#) to verify data, adjudicate study inclusion differences, and identify those that will participate in each step of the review process.

Assessing Feasibility

- How to [determine if the project is viable](#) or useful to the literature
- Checking if a review is already done, too little research, etc.
